Definition				
M	- 6 6 1.			

Mechanism of SI:

Definition: A fluid parcel with Potential Vorticity of opposite sign of the Coriolis parameter (<0 in the Northern Hemisphere) is unstable to along isopycnal perturbations.

In a 1D geostrophic framework, the Ertel's PV goes by:

$$q \equiv (f\hat{z} + \nabla \wedge u) \cdot \nabla \rho \propto f(f + \partial_x v) N^2 - (\partial_x b)^2 \quad \text{with } b \equiv -\frac{g\rho}{\rho_0}$$
(1)

Surface forcing (through buoyancy loss or down-front winds) can extract PV by weakening the stratification (N² \searrow) and enhancing density fronts (($\partial_x b$)² \nearrow)

Introduction	Symmetric instability	Numerical modelling of the NWMED	Conclusion	Appendix: SCVs

PV diagnostic				
Estimatin	g the PV from gl	iders data:		

- geostrophic currents perpendicular to the glider path are estimated from the integration of the vertical shear (thermal wind balance: $f\partial_z v = -\partial_x b$) from a filtered density section¹ to filter out small isopycnal oscillations due to internal waves.
- the cross-section depth-average currents (estimated by the glider navigation) are taken as a velocity reference.

• $PV = f(f + \partial_x v)N^2 - (\partial_x b)^2$ (assuming a 2D dynamics)

¹gaussian running mean (σ =2km) of significant width \sim 6km \rightarrow 4 \equiv 4 \equiv 4 \equiv 4 \equiv 4 \equiv 9 \triangleleft

LIW SCVs				

Observation of outstanding LIW SCVs in the Ligurian Sea:

Bosse et al (2015): Spreading of LIW by SCVs in the NW Mediterranean as observed with gliders, Journal of Geophysical Research

Over about 40 Nice-Calvi section, gliders observed 5 SCVs:

- depth-intensified velocities (anticyclonic SCVs, McWilliams [1985]);
- core of very well marked LIW (S \sim 38.7 (+0.1) and T \sim 13.8°C (+0.4°C)
- small radius (∼ 5km)
- (Ro ∼ 0.3 and Bu ∼ 0.3-1.3);
- peak velocity (~ 8cm/s) at intermediate depths (~ 400m).

000	000	00000	0	00000
LIW SCVs				

Process of formation: (D'Asaro [1988])

Non-conservative processes within the bottom boundary layer + flow detachment (curvature small enough at NW headland).

The formation of these SCVs seems to be closely linked to the circulation of AW at the surface (upwelling with southward surface flow = necessary condition).
